

### GENERAL DESCRIPTION

The XRP6141 is a synchronous step-down controller for point-of load supplies up to 35A. A wide 4.5V to 22V input voltage range allows for single supply operation from industry standard 5V, 12V and 19.6V rails.

With a proprietary emulated current mode Constant On-Time (COT) control scheme, the XRP6141 provides extremely fast line and load transient response using ceramic output capacitors. It requires no loop compensation hence simplifying circuit implementation and reducing overall component count. The control loop also provides exceptional line regulation and maintains constant operating frequency. A selectable power saving mode, allows the user to operate in discontinuous mode (DCM) at light current loads thereby significantly increasing the converter efficiency.

A host of protection features, including over-current, over-temperature, short-circuit and UVLO, help achieve safe operation under abnormal operating conditions.

The XRP6141 is available in RoHS compliant, green/halogen free space-saving 16-pin 3x3 QFN package.

### APPLICATIONS

- Networking and Communications
- Fast Transient Point-of-Loads
- Industrial and Medical Equipment
- Embedded High Power FPGA

### FEATURES

- **35A Capable Step Down Controller**
  - Wide Input Voltage Range
    - 5V to 22V Single Supply
    - 4.5V to 5.5V Low Vin
  - Integrated high Current 2A/3A Drivers
  - 0.6V to 18V Adjustable Output Voltage
- **Proprietary Constant On-Time Control**
  - No Loop Compensation Required
  - Ceramic Output Cap. Stable operation
  - Programmable 200ns-2µs
  - Constant 200kHz-800kHz Frequency
  - Selectable CCM or CCM/DCM Operation
- **Programmable hiccup current limit with thermal compensation**
- **Precision Enable and Power-Good Flag**
- **Programmable Soft-start**
- **Integrated Bootstrap diode**
- **16-pin QFN Package**

### TYPICAL APPLICATION DIAGRAM

Switching Frequency .....	200kHz-800kHz <sup>3</sup>
Junction Temperature Range .....	-40°C to 125°C

- Note 1: SW pin's minimum DC range is -1V, transient is -5V for less than 50ns  
 Note 2: No external voltage applied  
 Note 3: Recommended

**ELECTRICAL SPECIFICATIONS**

Specifications are for Operating Junction Temperature of T<sub>J</sub> = 25°C only; limits applying over the full Operating Junction Temperature range are denoted by a "•". Minimum and Maximum limits are guaranteed through test, design, or statistical correlation. Typical values represent the most likely parametric norm at T<sub>J</sub> = 25°C, and are provided for reference purposes only. Unless otherwise indicated, V<sub>IN</sub> = 12V, BST=V<sub>CC</sub>, SW=GND=PGND=0V, CGH=CGL=3.3nF.

## 35A Synchronous Step Down COT Controller

### PIN DESCRIPTION

Name	Pin Number	Description
GL	1	Driver output for Low-side N-channel synchronous MOSFET.
NC	2	Internally not connected. Leave this pin floating.
SW	3	Lower supply rail for high-side gate driver GH. Connect this pin to the junction between the two external N-channel MOSFETs.
GH	4	Driver output for high-side N-channel switching MOSFET.
BST	5	High-side driver supply pin. Connect a 0.1uF bootstrap capacitor between BST and SW.
ILIM	6	Over-current protection programming. Connect with a resistor to the Drain of the low-side MOSFET.
EN/MODE	7	Precision enable pin. Pulling this pin above 1.9V will turn the IC on and it will operate in Forced CCM. If the voltage is raised above 3.0V then the IC will operate in DCM or CCM depending on load.
TON	8	Constant on-time programming pin. Connect with a resistor to AGND.
SS	9	Soft-Start pin. Connect an external capacitor between SS and AGND to program the soft-start rate based on the 10uA internal source current.
PGOOD	10	Power-good output. This open-drain output is pulled low when V <sub>OUT</sub> is outside the regulation.
FB	11	Feedback input to feedback comparator. Connect with a set of resistors to V <sub>OUT</sub> and GND in order to program V <sub>OUT</sub> .
AGND	12, 13	Analog ground. Control circuitry of the IC is referenced to this pin.
VIN	14	IC supply input. Provides power to internal LDO.
VCC	15	The output of LDO. For operation using a 5V rail, VCC should be shorted to VIN.
PGND	16	Low side driver ground
Exposed Pad		Thermal pad for heat dissipation. Connect to AGND with a short trace.

**DETAILED OPERATION**

XRP6141 is a synchronous step-down proprietary emulated current-mode Constant On-Time (COT) controller. The on-time, which is programmed via RON, is inversely proportional to VIN and maintains a nearly constant frequency. The emulated current-mode control allows the use of ceramic output capacitors.

Each switching cycle begins with GH signal turning the high-side (switching) FET for a preprogrammed time. At the end of the on-time the high-side FET is turned off and the low-side (synchronous) FET is turned on for a preset minimum time (250ns nominal). This parameter is termed Minimum Off-Time. After the minimum off-time the voltage at the feedback pin FB is compared to an internal voltage ramp at the feedback comparator. When VFB drops below the ramp voltage, the high-side FET is turned on and the cycle repeats. This voltage ramp constitutes an emulated current ramp and makes possible the use of ceramic capacitors, in addition to other capacitor types, for output filtering.

**ENABLE/MODE**

EN/MODE pin accepts a tri-level signal that is used to control turn on/off. It also selects between two modes of operation: 'Forced CCM' and 'DCM/CCM'. If EN is pulled below 1.9V the IC shuts down. A voltage between 1.9V and 3V selects the Forced CCM mode, which will run the converter in continuous conduction at all times. A voltage higher than 3V selects the DCM/CCM mode, which will run the converter in discontinuous conduction at light loads. DCM/CCM, which is based on diode emulation, is described below.

**Diode Emulation Mode (DCM/CCM)**

Diode Emulation Mode is designed to increase the converter efficiency at light loads. Light-load efficiency is increased by preventing negative inductor current. This is achieved by monitoring the inductor current valley (bottom) via SW and turning off the synchronous FET as inductor current  $I_L$  approaches zero.  $I_L$  is monitored indirectly by monitoring  $V_{SW}$  during the synchronous FET conduction (i.e.,  $V_{SW} = I_L \times R_{ds}$ ). If  $V_{SW}$  does not drop to  $-1mV$  the converter operates in continuous conduction as shown in figure 28. If  $V_{SW}$  equals  $-1mV$  then a zero-crossing is detected (figure 29). Eight consecutive zero-crossings activate the diode emulation mode. Then, on every subsequent switching cycle, GL is turned off when  $V_{SW}$  reaches  $-1mV$  (figure 30). If  $I_{OUT}$  decreases further, discontinuous conduction ensues (figure 30). The constant on-time delivers a fixed energy at the start of each switching cycle. The synchronous FET is turned off when  $V_{SW}$  drops to  $-1mV$ . Remaining inductor energy is discharged through the FET's body diode. Now, because  $I_{OUT}$  is low, it takes longer for  $V_{OUT}$  to drop below regulation and trigger a new switching cycle. Hence switching frequency  $f$  decreases. This increase the efficiency at light loads.

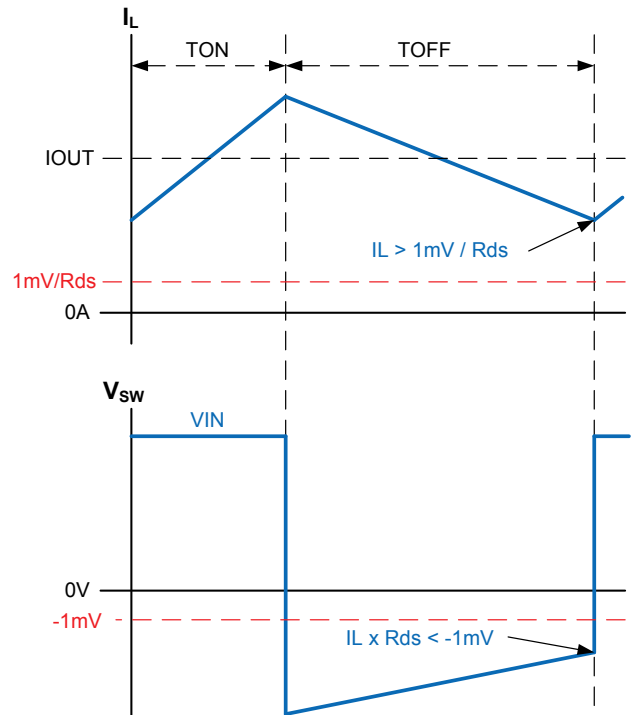

Figure 28. Continuous conduction during diode emulation

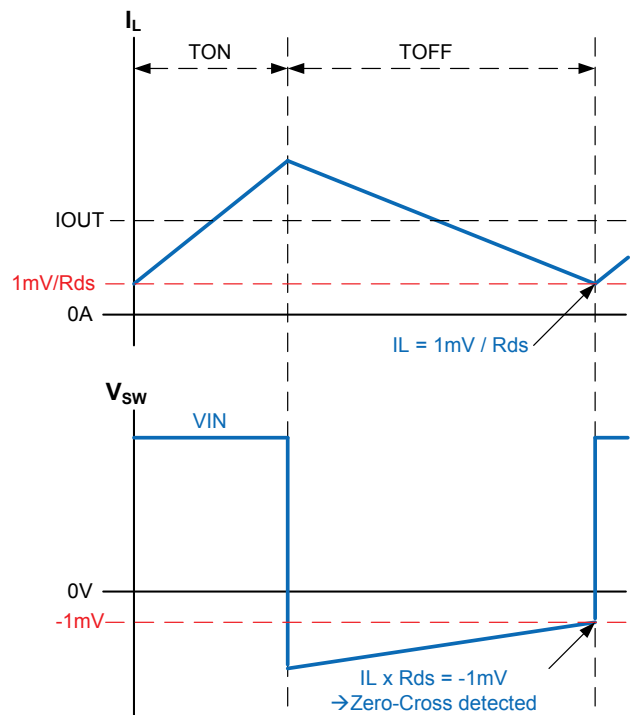

Figure 29. Zero-Crossing detection

Figure 30. Discontinuous conduction during diode emulation

### PROGRAMMING THE ON-TIME

The on-time  $T_{ON}$  is programmed via resistor  $R_{ON}$  according to following equation:

$$T_{ON} = \frac{(3.4E - 10) \times R_{ON}}{V_{IN}}$$

The required  $T_{ON}$  for a given application is calculated from:

$$T_{ON} = \frac{V_{OUT}}{V_{IN} \times f}$$

Note that switching frequency  $f$  will increase somewhat, as a function of increasing load current and increasing losses (see figure 22).

### OVER-CURRENT PROTECTION (OCP)

If load current exceeds the programmed overcurrent  $I_{OCP}$  for four consecutive switching cycles, then IC enters hiccup mode of operation. In hiccup the MOSFET gates are turned off for 110ms (hiccup timeout). Following the hiccup timeout a soft-start is attempted. If OCP persists, hiccup timeout will repeat. The IC will remain in hiccup mode until load current is reduced below the programmed  $I_{OCP}$ . In order to program overcurrent protection use the following equation:

$$R_{LIM} = \frac{(I_{OCP} \times R_{DS}) + 8mV}{I_{LIM}}$$

Where:

$R_{LIM}$  is resistor value for programming  $I_{OCP}$

$I_{OCP}$  is the overcurrent value to be programmed

$R_{DS}$  is the MOSFET rated on resistance

8mV is the OCP comparator offset

$I_{LIM}$  is the internal current that generates the necessary OCP comparator threshold (use 45uA)

Note that  $I_{LIM}$  has a positive temperature coefficient of 0.4%/°C. This is meant to roughly match and compensate for positive temperature coefficient of the synchronous FET. In order for this feature to be effective the temperature rise of the IC should approximately match the temperature rise of the FET.

### SHORT-CIRCUIT PROTECTION (SCP)

If the output voltage drops below 60% of its programmed value, the IC will enter hiccup mode. Hiccup will persist until short-circuit is removed. SCP circuit becomes active after  $P_{GOOD}$  asserts high.

### OVER-TEMPERATURE PROTECTION (OTP)

OTP triggers at a nominal die temperature of 150°C. The gate of switching FET and synchronous FET are turned off. When die temperature cools down to 135°C, softstart is initiated and operation resumes.

### PROGRAMMING THE OUTPUT VOLTAGE

Use an external voltage divider as shown in figure 1 to program the output voltage  $V_{OUT}$ .

$$R1 = R2 \times \left( \frac{V_{OUT}}{0.6} - 1 \right)$$

$R2$  recommended range is 2kΩ to 10kΩ.

### PROGRAMMING THE SOFTSTART

Place a capacitor  $C_{SS}$  between the SS and GND pins to program the softstart. In order to program a softstart time of TSS, calculate the required capacitance  $C_{SS}$  from the following equation:

$$C_{SS} = TSS \times \frac{10\mu A}{0.6V}$$

### FEED-FORWARD CAPACITOR CFF

A feed-forward capacitor  $C_{FF}$  is recommended.  $C_{FF}$  provides a low-impedance/high-frequency path for the output voltage ripple to be transmitted to FB. It also helps get an optimum load transient response. Calculate  $C_{FF}$  from:

$$C_{FF} = \frac{1}{2 \times \pi \times f_s \times 0.1 \times R1}$$

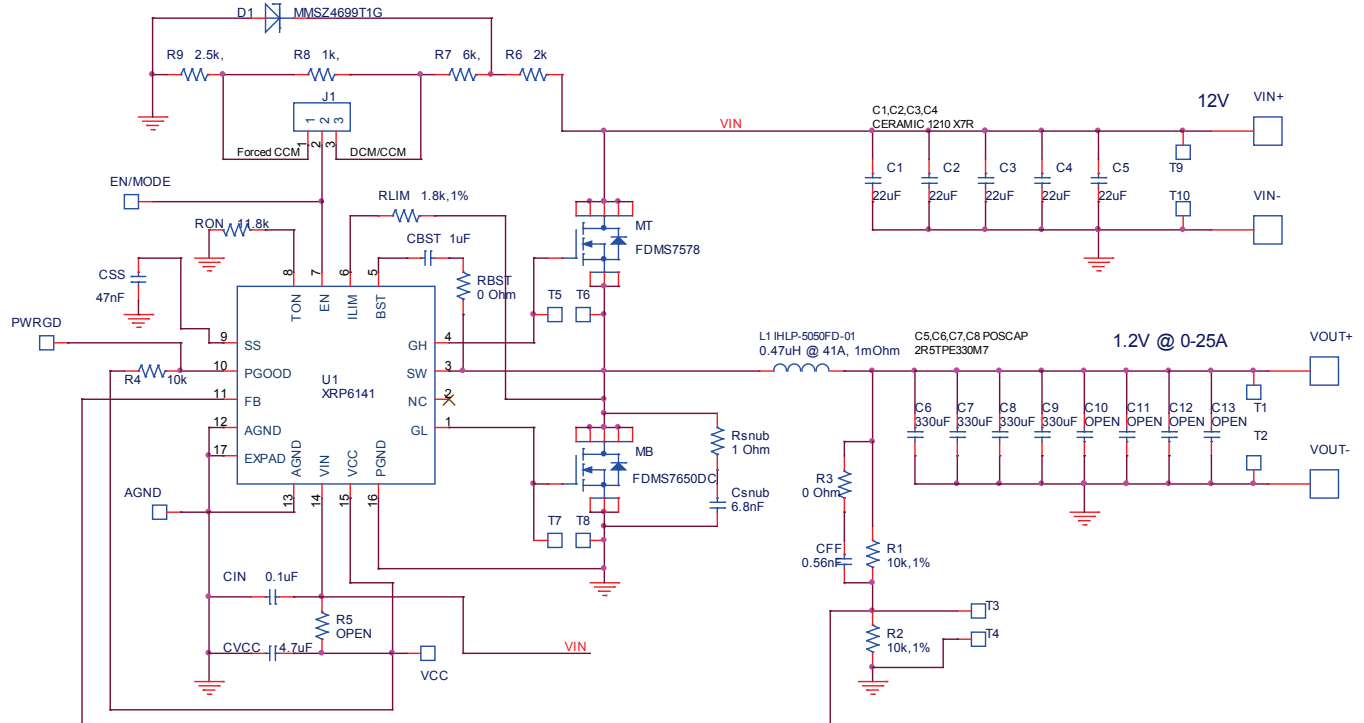

A New Direction in Mixed-Signal

# XRP6141

## 35A Synchronous Step Down COT Controller

### Applications Circuit

**Note:** If jumper J1 is set to CCM position, the converter will operate in 'Forced CCM' at  $V_{IN}=12V(+/-10\%)$ . In order to operate in Forced CCM over a wider  $V_{IN}$  range, remove Jumper and apply an auxiliary voltage in the 1.9V-3V range to the EN/MODE test point.

If jumper J1 is set to DCM/CCM position the converter will operate at DCM or CCM, depending on load, at  $V_{IN}=12V(+/-10\%)$ . In order to operate in DCM/CCM over a wider  $V_{IN}$  range, remove Jumper and apply an auxiliary voltage in the 3.1V-5V range to the EN/MODE test point.
